Discrete Event Simulation And System

A discrete-event simulation (DES) models the operation of a system as a sequence of events in time. Each event occurs at a particular instant in time and marks a change of state in the system. [1] Between consecutive events, no change in the system is assumed to occur; thus the simulation time can directly jump to the occurrence time of the next event, which is called next-event time progression .

A hybrid simulation approach is presented in this paper, which aims to offer hospital managers a chance at investigating the patient boarding problem. Integrating 'System Dynamic' and 'Discrete Event Simulation' enables the user to ease the complexity of patient flow at both macro and micro levels.

Discrete event simulation (DES) and system dynamics (SD) are two modelling approaches widely used as decision support tools in logistics and supply chain management (LSCM). A widely held belief exists that SD is mostly used to model problems at a strategic level, whereas DES is used at an operational/tactical level.

The application of discrete event simulation and system ...

Discrete event simulation focuses on the processes in a system at a medium level of abstraction. Typically, specific physical details, such as car geometry or train acceleration, are not represented. Discrete event simulation modeling is widely used in the manufacturing, logistics, and healthcare fields.

In discrete systems, the changes in the system state are discontinuous and each change in the state of the system is called an event. The model used in a discrete system simulation has a set of numbers to represent the state of the system, called as a state descriptor. In this chapter, we will also learn about queuing simulation, which is a very important aspect in discrete event simulation along with simulation of time-sharing

system.

System Dynamics models consist of a system of stocks and flows where continuous state changes occur over time. Whereas Discrete-Event Simulation models systems as a network of queues and activities, where state changes occur at discrete points of time (Brailsford and Hilton, 2001). In SD the entities are presented as a continuous quantity.
