The Vehicle Routing Problem Latest

The Vehicle Routing Problem (VRP) has been an especially active and fertile area of research. Over the past five to seven years, there have been numerous technological advances and exciting challenges that are of considerable interest to students, teachers, and researchers. The Vehicle Routing Problem: Latest Advances and New Challenges will focus on a host of significant technical advances that have evolved over the past few years for modeling and solving vehicle routing problems and variants.

This chapter presents an overview of the Period Vehicle Routing Problem, a generalization of the classic vehicle routing problem in which driver routes are constructed over a period of time. We survey the evolution of the PVRP and present a synopsis of modeling and solution methods, including classical heuristics, metaheuristics, and ...

In this paper we propose an efficient heuristic for the Vehicle Routing Problem on Trees (TVRP). An initial solution is constructed with a greedy algorithm based on the Depth-First Search (DFS) approach. To optimize initial solutions obtained by our DFS heuristic, Ruin-and-Recreate (RR) method is then

The vehicle routing problem is a combinatorial optimization and integer programming problem which asks "What is the optimal set of routes for a fleet of vehicles to traverse in order to deliver to a given set of customers?". It generalises the well-known travelling salesman problem. It first appeared in a paper by George Dantzig and John Ramser in 1959, in which the first

Vehicle routing problem - Wikipedia

The vehicle routing problem (VRP) is a well-known combinatorial optimization problem that involves arranging a set of optimal routes for a fleet of vehicles to visit customers with the shortest total travel distance or the lowest cost, and it was first introduced by Dantzig and Ramser (1959).
